

Figure 1 is a line graph showing the evolution of the normalized difference in the cost function, $\Delta C/C$, as a function of lead time (months). The x-axis represents lead time in months (1, 3, 6). The y-axis represents the normalized difference in the cost function, $\Delta C/C$. A horizontal line at $\Delta C/C = 0$ indicates the reference level. Most models show a sharp decrease in $\Delta C/C$ from 1 month to 3 months, followed by a slight increase or stabilization at 6 months. The models are distinguished by different colors and line styles: solid lines with markers (blue, green, red, purple, brown, grey, yellow) and dashed lines (orange, pink, light green). Error bars are shown for each data point.
